

CUSTOMIZE YOUR MACHINE!

Customizing and setting up your machine is one of the enjoyable aspects of R/C models and Tamiya offers a broad range of Option & Spare Parts for these purposes. Check out the following basic points to enhance your model's performance.

Most Important: Tires

Tires transmit motor power directly to the track, hence it is very important to select proper tires according to the track surface for the best performance. By installing front and rear tires with different characteristics, your machine's handling performance can be changed.

Tuning for Improved Cornering

The first step is the installation of oil dampers, such as CVA Shock Units, TRF Dampers, and Aeration Dampers, which allow a wider range of settings through the use of different oils and coil springs.

Many Option Parts to choose from.

Drivetrain Efficiency

The installation of ball bearings minimizes friction loss to help increase top speed and extend driving time as well. Use of lightweight aluminum propeller shafts, universal drive shafts, and low-friction drive belts is also recommended.

Selecting A Motor

Tamiya offers a range of high-performance motors, including brushless motors. Select a suitable one according to the car type and the driving conditions.
